

Revision of DSA Topics

Agenda

1. Recursion
2. Dynamic Programming
 - Memoisation
 - Tabulation
3. Graphs
 - DFS
 - BFS

Hello Everyone

very special Good Evening

to All of you 😊

We will start

from 9:06 PM

Content of DSA 4.2:

- | | | |
|--|-------|---|
| 1. Revision of DSA topics | _____ | 1 |
| 2. Maths : Inverse modulo and problems | _____ | 1 |
| 3. Backtracking | _____ | 1 |
| 4. Trie | _____ | 2 |
| 5. String Matching | _____ | 1 |
| 6. DP | _____ | 2 |
| 7. Graphs | _____ | 2 |
| 8. Contest | _____ | 1 |

Scaler Adventure Park :

Scaler has opened an Adventure Park and there is a staircase. Every staircase has a cost associated that you need to pay when you claims it.

You can either start from the 0th staircase or the 1st staircase.

* You can take 1 size jump or 2 size jump from any stair.

Goal: What is the least amount of money you can spend to reach the top.

$$\text{Cost} = 10 + 5 + 8 + 15 + 25 + 12 = 75$$

$$\text{Cost} = 10 + 5 + 8 + 15 + 10 + 12 = 60$$

$$\text{Cost} = 10 + 5 + 15 + 10 + 12 = 52$$

$$\text{Ans} = \min \text{Cost} (75, 60, 52, \dots)$$

$$= 52 \text{ Ans}$$

$$\text{cost}(i) = \min(\text{cost}(i-1), \text{cost}(i-2)) + A[i]$$

min from Intermediate

Self cost

$$i \longrightarrow (i-1), (i-2)$$

Base case

✓	0	→	-1X OR -2X
✓	1	→	0 ✓ OR -1X

$$\minCost(arr[], i) = \min \left(\begin{array}{l} \minCost(arr[], i-1) + arr[i] \\ \minCost(arr[], i-2) + arr[i] \end{array} \right)$$

pseudocode:

```
int minCost(int n, int i) {
```

```
if (i == 0 || i == 1) {
```

```
| return arr[i];
```

3

```
int val1 = minCost(arr, i-1);
```

```
int val2 = minCost(arr, i-2);
```

```
return min(val1, val2) + arr[i];
```

TC: $O(2^n)$

S.C: $O(n)$

3

$[9 \quad 5 \quad 7 \quad 13 \quad 2]$
0 1 2 3 4

$12 + 2 = 14$ ans
 $arr, 4$
 $S + 13 = 18$
 $S + 7 = 12$

$$5 + 7 = 12$$
$$5 + 7 = 12$$
$$arr_2$$

52

$arr, 1$

Ques, 1

arr, D

am,

arr, 5

solving a subproblem which is already solved,

$$\text{Total call} \Rightarrow 2^1 + 2^2 + 2^3 + \dots + 2^n$$

$$\text{Sum of GP} = ? \quad \text{---}$$

$$T.C: O(2^n)$$

$$T(n) = T(n-1) + T(n-2) + k \quad \longrightarrow \text{Recursive relation of fibonacci}$$

calculate $T(n)$?

$$T(n-2) + T(n-2) + k < T(n) < T(n-1) + T(n-1) + k$$

$$\underbrace{2T(n-2) + k}_{f_1(n)}$$

$$< T(n) < \underbrace{2T(n-1) + k}_{f_2(n)}$$

↓

$$\underbrace{2^n}_{\text{upper bound}}$$

upper bound

$$\Rightarrow T(n) : O(2^n)$$

Dynamic Programming:

- ① memoisation : [Top down] : Recursive
- ② Tabulation : [Bottom up] : Iterative

* Memoisation:

1. Decide storage
2. Store your answer in the storage before returning it
3. check if answer is pre-calculated.

int[] dp[N]: * initialised with -1

```
int minCost( arr[], int i) {  
    if( i==0 || i==1) {  
        return dp[i]=arr[i];  
    }  
    if(dp[i] != -1) {  
        return dp[i];  
    }  
    int val1 = minCost(arr, i-1);  
    int val2 = minCost(arr, i-2);  
    return dp[i] = min(val1, val2) + arr[i];  
}
```

arr: [10, 20, 5, 8, 15]

dp: [~~10~~, ~~20~~, ~~15~~, ~~22~~, ~~30~~]

T.C: O(n)

S.C: O(n)

Tabulation: (Bottom up)

arr: [10, 20, 5, 8, 15]
 0 1 2 3 4

dp: [10, 20, 15, 23, 30]
 0 1 2 3 4

dp[i] → min cost to reach at
 ith stair

```
int[] dp[n];
```

```
dp[0] = arr[0];
```

T.C: $O(n)$

S.C: $O(n)$

```
dp[i] = arr[i];
```

```
for(int i=2; i<n; i++){
```

```
    dp[i] = min(dp[i-1], dp[i-2]) + arr[i];
```

```
}
```

```
return dp[n-1];
```

to prepare c → always using
 previous two variable i.e. a & b.

$c \Rightarrow \min(a, b) + arr[i]$

Optimise space complexity

```
int a = arr[0], b = arr[1];
```

```
for(int i=2; i<n; i++){
```

```
    int c = min(a, b) + arr[i];
```

```
    // prepare a & b for next iterations
```

```
    a = b;
```

```
    b = c;
```

```
}
```

```
return b;
```

Edge case

no. of stair = n

$n=2 \rightarrow 5$?

think why?

→ TODO ?

~~~~~ Graphs :

~~~~~  
\* **Definition** : Nodes connected via edge: Graphs

\* **Difference between Trees and Graphs**

\* **Classification of Graphs**

**Difference:**

A graph is a tree?  $\rightarrow$  No

A tree is a graph?  $\rightarrow$  Yes

① Trees are hierarchical unlike graphs.

② no. of edge in a tree is exactly  $(n-1)$  for  $n$ -nodes.

**Classification:**

① Undirected graph  
(facebook)

directed graph  
(Instagram)

② weighted

unweighted

③

④

Degree

degree of 1  $\rightarrow$  4

degree of 4  $\rightarrow$  2

In/out - degree

In degree of 1  $\rightarrow$  3

out degree of 1  $\rightarrow$  2

In degree of 5  $\rightarrow$  0

Break: 10:24 - 10:34 Am

Input and Storage of Graphs

Undirected weighted graph

Nodes = 9 → 1 to 9  
          ↳ 0 to 8

Edges = 9

| u | v | wt |
|---|---|----|
| 0 | 3 | 40 |
| 0 | 1 | 10 |
| 1 | 2 | 10 |
| 2 | 3 | 10 |
| 3 | 4 | 4  |
| 4 | 5 | 3  |
| 5 | 6 | 3  |
| 4 | 6 | 8  |
| 7 | 8 | 4  |

Input: Edges and weight associated with it.

Store:

- \* Adjacency Matrix
- \* Adjacency List

# Adjacency matrix:

Nodes = 9  
Edges = 9

List < List < Node > >

~

↳ Neighbour  
weight

```
~~~~~
1. DFS : Depth First Search
2. BFS : Breadth First Search
```

A graph with 9 vertices labeled 0 through 8. The vertices are arranged in two rows. The top row contains vertices 0, 3, 4, and 8. The bottom row contains vertices 1, 2, 5, 6, and 7. Edges connect the following pairs of vertices: (0, 1), (1, 2), (2, 3), (3, 4), (4, 5), (5, 6), (6, 7), (7, 8), (0, 3), (3, 2), (4, 6), and (5, 4).

resolution: track visited nodes  
→ boolean visited array

assumption:

List < List < Int > > graph : given

```
boolean[] vis = new boolean[n];
// initially all cells are false.
```

```
for(int v=0; v<n; v++) {
 | if(vis[v] == false) {
 | | dfs(graph, v, vis);
 | |
 | }
 }
}
```

```
dfs(graph, int v, boolean[] vis) {
```

```
 | print(v);
 | vis[v] = true;
 |
 | for(int nbr : graph[v]) {
 | | if(vis[nbr] == false) {
 | | | dfs(graph, nbr, vis);
 | | |
 | | }
 | | }
 | }
 }
}
```

T.C:  $O(V+E)$

S.C:  $O(V)$   $\longrightarrow$  TODO why?

Check the level of Recursion.

$\longrightarrow$  Explain: think about why?

Breadth First Search: → Similar to level order traversal

### Steps of BFS

- \* Rem
- \* mark \* → if already marked continue
- \* Print
- \* Add unvisited nbr

Data Structure: Queue

~~0, 1, 3, 2, 2\*, 4, 5, 6, 6\*, 7, 8~~

0 —  
1 ]  
3 ]  
2 ]  
4 ]  
5 ]  
6 ]  
7 ]  
8 ]

Expansion: Radial movement  
OR  
Radial expansion

→ Breadth First Search

## pseudocode:

assumption: graph is given  $\text{List<List<Int>> graph}$

```
boolean[] vis = new boolean[n];
```

```
for(int v=0; v<n; v++) {
```

```
 if(vis[v] == false) {
```

```
 | bfs(graph, v, vis);
```

```
 }
```

```
}
```

```
void bfs (graph, int src, boolean[] vis) {
```

```
 Queue<int> que;
```

```
 que.add(src);
```

```
 while(que.size() > 0) {
```

```
 // 1. remove
```

```
 int rem = que.remove();
```

```
 // 2. mark *
```

```
 if(vis[rem] == true) continue;
```

```
 vis[rem] = True;
```

```
 // 3. print
```

```
 print(rem);
```

```
 // 4. add unvisited nbr
```

```
 for(int nbr : graph[rem]) {
```

```
 | if(vis[nbr] == false) {
```

```
 | que.add(nbr);
```

```
 }
```

```
 }
```

```
 }
```

```
}
```

T.C:  $O(V+E)$

S.C:  $O(V)$

Think why??
